

Semi-Automatic Plate Shifter

The M.W. Watermark Semi-Automatic Plate Shifter allows for easy, single-person operation of the press empty/filter cake discharge cycle.

The operator positions the shifter between filter plate handles and then presses and holds the rocker switch to shift the next plate. The operator must maintain pressure on the rocker switch during the plate shift or the shifter will stop and remain in the non-functioning position until the operator again applies pressure to the rocker switch.
